
Warby Parker Landing Page A/B Test & User Satisfaction Analysis

Prepared by: Sofia Rueda

Date: June 2025

1. Introduction

Warby Parker conducted an A/B test to evaluate the impact of changing their landing page messaging on user satisfaction. The control version featured the phrase "**Try on 5 frames without leaving home**" with a Home Try-On box graphic, while the test version said "**Good things await you**" and showed two people wearing frames.

Users rated their satisfaction on a 5-point scale after interacting with the pages. Additional demographic data including region, age, and income were collected. This report analyzes whether the new landing page impacts satisfaction overall and explores demographic trends.

2. Hypotheses for the A/B Test

- **Null Hypothesis (H_0):** There is no difference in user satisfaction between the control and test landing pages.
 - **Alternative Hypothesis (H_1):** There is a difference in user satisfaction between the two landing pages.
-

3. Statistical Test Results

A two-tailed test was conducted to compare average user satisfaction scores between the control and test groups.

- **p-value = 0.15**
- **Significance level (α) = 0.05**

Since the **p-value (0.15) > α (0.05)**, we **fail to reject the null hypothesis**. This means the test did not find a statistically significant difference in overall user satisfaction between the two landing pages at the 95% confidence level.

4. Interpretation and Recommendation

Because the difference was not statistically significant, Warby Parker should **not** change the landing page based solely on this test. The result suggests that the new version does not reliably improve user satisfaction compared to the control.

5. Risk of Errors

The conclusion could be incorrect if the truth differs from the test result. In this case:

- We risk making a **Type II error** (false negative), failing to detect a real difference that exists.
 - This means Warby Parker might miss an opportunity to improve satisfaction and engagement by adopting the new landing page.
-

6. Demographic Trends Exploration

Despite no overall significant difference, further analysis was conducted to explore if satisfaction varies by **region, age, or income**.

6.1 Satisfaction by Region

A PivotTable was created to calculate the average user rating by region:

Region	Average User Rating
1 (Northeast)	3.00
2 (South)	3.74

3 (Midwest) 3.64

4 (West) 2.26

Overall Avg 3.34

The South and Midwest regions have higher than average satisfaction, while the West shows much lower ratings, suggesting regional preferences or disconnects.

6.2 Average Age by Region

Region	Average Age
1 (Northeast)	35
2 (South)	34
3 (Midwest)	37
4 (West)	41
Overall Avg	37

Users in the West tend to be older, which may influence their lower satisfaction scores.

6.3 Average Income by Region

Region	Average Income
1 (Northeast)	\$65,326.78
2 (South)	\$67,370.96
3 (Midwest)	\$74,785.86
4 (West)	\$74,157.30

Higher incomes in the Midwest and West add another demographic layer for consideration.

6.4 Satisfaction by Age Group (Under 25 vs 25 and Older)

Users were segmented by age (under 25 vs 25 or older):

Age Group	Average User Rating
No (< 25)	4.84
Yes (25+)	3.14

Younger users rate the landing page significantly higher, indicating the page appeals more to a younger demographic.

7. Summary and Business Implications

While the overall A/B test did not show a statistically significant difference in user satisfaction, demographic analysis reveals meaningful trends. The landing page resonates better with younger users and users in the South and Midwest, but not with older users or those in the West.

These insights suggest that a **one-size-fits-all approach may not maximize user satisfaction** across Warby Parker's diverse customer base. Future efforts could include:

- Tailoring messaging and visuals by **region** and **age group**.
- Running **region-specific or age-targeted** A/B tests.
- Increasing sample sizes to reduce Type II error risk.
- Collaborating closely with the data team at test design stage to improve statistical power and clarity.

By addressing these factors, Warby Parker can better engage customers, enhance satisfaction, and potentially increase conversions and revenue over time.
